

Huron Garden
CANNABIS

Family Owned - Locally Grown

Huron Garden Cannabis is a family owned and operated indoor cannabis grow facility located in Harrisville, MI. Our employees hold degrees in horticulture, engineering and information technology.

We enjoy growing a wide variety of boutique cultivars including landrace (non-hybrid) and high CBD strains that you won't find in most dispensaries.

Our focus is on quality and consistency. We carefully dry and cure our flower to the ideal 9-13% moisture content, resulting in a mild and flavorful smoke.

In our state-of-the-art facility, we grow cannabis year-round, hydroponically, and under precise environmental control.

Our mechanical systems are located outside of the grow rooms for ease of maintenance and to avoid contamination.

We collect and re-cycle 90% of the irrigation water that we collect as condensate from the grow rooms.

We filter and sanitize the water, using ozone to destroy any possible microbial contamination and deliver oxygen deep into the root zone of the plants – keeping them healthy, improving their ability to uptake nutrients and allowing them to flourish.

We start our plants from seed or in-house clones, to prevent importing plant-borne diseases or insect pests.

We utilize food-grade Sanuvox air sanitizers to keep our grow rooms free of microbial contamination.

Our veg room and flower room plants develop under a unique LED light spectrum that is tuned to their individual growth stage.

Nine identical flower rooms allow us to grow multiple strains continuously throughout the year.

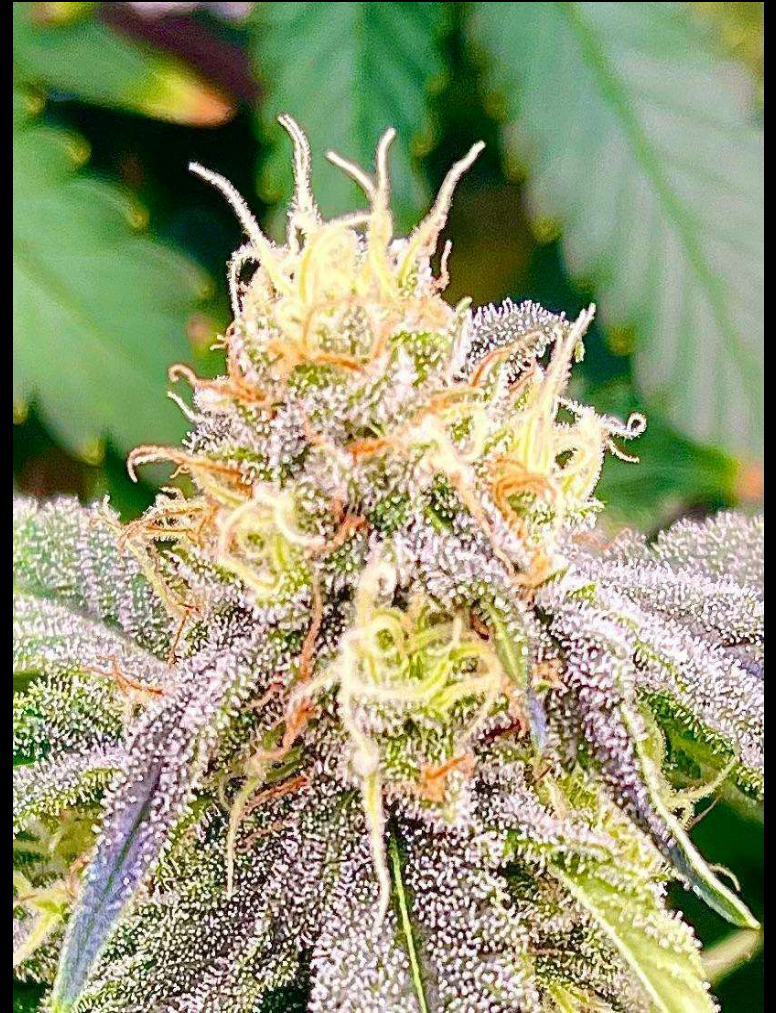

Harvest Time! Cannabinoids and Terpenes

Cannabis contains over 150 cannabinoids, with THC and CBD being the two most recognized. Cannabis terpenes provide the aroma and flavor, and work in combination with cannabinoids to enhance the high, often referred to as the “entourage effect”.

Cannabinoid and terpene compounds are located in the trichomes of the plant; the sticky, hair-like “frosty” glands on the plant’s flowers and leaves.

At Huron Garden Cannabis, we harvest our plants at the peak of ripeness when the trichomes are cloudy or milky white (maybe with a few amber colored ones), the pistils on the bud have turned color from white to orange, red, brown, or purple, and the buds are plump with a sticky and resinous texture.

Trust your Budtender!

Huron Garden Cannabis encourages consumers to try a variety of cannabis flower varieties, regardless of THC concentration.

You might be surprised at the flavorful smoke and excellent high from a well cured, high terpene, cannabis flower in the 15-20% range.

Also, don't forget to try a high CBD strain, especially before or after strenuous activity.

Trust your budtender!
