## **LandScape Segment Descriptions**

### **Pushing Through (M4)**

Pushing Through segments are similar to segments in many demographics as Still Standing such as age (20- to low- 30- years-old), except for one predominant distinction - they are home to the "blue-collar" workers in occupations such as healthcare, building maintenance, production, and transportation. In these employment fields, they rank at over two- times- the- national- average. However, their median annual income is still the same as residents of Standing Tall areas: the low- \$30,000s or less. Also, Pushing Through neighborhoods rank at between 50- and- 75- percent- above- average in residents who've never been married. In fact, they rank at 50- percent- below- average number of married- couple households, including a 50- percent- higher- than- average percent of single- male parents and nearly two- times- average number of single- female parent families. Other similarities to their Still Standing neighbors include: an above- average level of income from public- assistance (nearly three- times- the- national- average). Though many residents have high- school degrees, a two- times- average level of residents do not have high- school educations.

### **Still Standing (M3)**

Residents of Still Standing neighborhoods may face greater challenges than most Americans, but you can't say they aren't trying. These areas are home to people in their 20s to low- 30s, who rank at the national- average in income from salaries and wages. However, they also show about two- and- a- half- times- average- higher rate of public- assistance income. These residents are working at a wide variety of jobs, including an over two- times- average level of employment in healthcare services; nearly two- times- average in building maintenance; and over 50- percent- above- average in protective services, food preparation, and personal care industries. All in all their positions are categorized as white- collar, unlike the Standing Tall segments, which work in similar fields, but weight in as blue- collar. But with a 50- percent- higher- than- average- level of residents without high- school educations, and a median- salary range in the low- \$30,000s or less, these residents may continue to carefully spend the money they bring home. Additional distinctions include a between 50- and- 75- percent- above- average percentage who've never married; a well above- average number of children; and a 50- percent- below- average number of married- couple households. Additionally, there is a 50- percent- higher- than- average percent of single- male parents and nearly two- times- average number

### **Standing Tall (M2)**

Within occupations such as healthcare, protective services, and office administration, you'll find levels of status and income. Residents of Standing Tall market segments are at the higher ends of both scales, estimated chiefly on the neighborhoods' median income range, which is high- \$30,000s to the \$40,000s. They also have the second lowest ranking on public- assistance income in their market segmentation category: about 50- percent- the- national- average. Overall, these demographic facts put the Standing Tall residents in a very comfortable consumer category. Residents inhabiting these areas are overwhelmingly in their 30s, have high- school degrees, are single- parent households, and have an average number of children under their roofs. Specifically, Standing Tall segments have about a 50- percent- higher- than- average percent of single- parent homes, but well- over- two- times- the- national- average are with female- heads- of- households. These areas also have an over- 25- percent- higher- than- average number of divorcees and widows/widowers.

### **Collegians (O7)**

According to the U.S. Dept. of Labor's Bureau of Labor Statistics, in October 2004, 66.7% of high- school graduates from the class of 2004 were enrolled in colleges or universities across the United States. This is obviously a huge annual boon to retailers who sell the staples of college life, including low- cost dorm- style furniture, pens and notebooks, and inexpensive home furnishings. Collegians areas are home to currently enrolled college students living in either dorms or off campus areas dedicated to college students. Market researchers will find a very homogenous group of young adults within these unique areas. Collegians are home to residents sharing a median- age- range in the 20s and low- 30s. They are predominately not married, and have no children. Naturally, they all have high- school degrees. For those students who are working to help pay the ever- increasing cost of higher education, they are employed a mix of white- and blue- collar occupations, such as protective services (over- two- times- average), personal care (nearly two- times- average), and management and sales (nearly 50- percent- above- average). Through these jobs they generate annual incomes at the low- \$30,000s- or- less range. Residents in these areas generate almost no public- assistance income.

## **Los Solteros (N5)**

Among the six primarily Hispanic Mundo Latino neighborhood segments, the Los Solteros are among three with the highest income- levels: the high- \$30,000s to \$40,000s. However, that doesn't mean they aren't struggling, because other factors speak to people working hard to make ends meet. For one things, these highly urban areas are home to predominately single- households, in particular single- parent families: hence their name - Los Solteros mean "singles" in Spanish. They rank at two- times- the- national- average for single- male- parent and single- female- parent households. A 50- percent- higher- than- average number of these residents have never been married. There are above- average numbers of children of all ages in the households, with the highest percent in the younger group (under six- years- old) and fewer in the oldest grouping (13 to 17 years old). Another fact pointing to their financial struggle is the high level of income from public- assistance: more than three- times- average. With a two- and- a- half- times- average level of residents with less- than- high- school educations, residents of Los Solteros areas are employed in predominantly blue- collar manual- labor jobs, with higher- than- average rankings in all of these occupations: building maintenance, food preparation, construction, production, transportation, healthcare support, and farming/fishing/forestry.

## **Legacy Years (O6)**

There are two images of that come to mind when you say "senior citizen" in the United States. One is of a very well off retired person living out their golden years in comfort. A second image is of an older person who is struggling to make ends meet and suffering the indignities of a combination of old- age and low- income. Legacy Years are areas representing households that are fully retired with residents on very tight budgets. The median age in these neighborhoods is the 50s and low- 60s, but they also have a nearly three- times- the- national- average number of people over 65- years- old. The median income of these households is the low- \$30,000s or less. While many residents are drawing on social security and retirement income, they also have a 75- percent- above- average ranking in public- assistance. This group of senior citizens also ranks above- average on several occupational categories, which is either a reflection of the employment of the younger members of the neighborhood or the need for some seniors to continue working. They show above- average levels of employment in both blue- and white- collar jobs in these areas:

## **Centurions (O5)**

It would come as no surprise to most people that military personnel living across the country have their own unique demographics and lifestyle segmentation characteristics from non- military people. Just one example of this, and reason for this fact, is that this population tends to retire at a considerably younger age than workers in civilian sectors. Among the explanations for this pattern is that many military tasks require the physical stamina of youth. Market segmentation bears out this fact, as the population of Centurions segments are in their 20s and low- 30s. Centurions neighborhoods are classified as highly urban areas with households dominated by military personnel. Other commonalities of the residents include salary ranges in the high- \$30,000s and the \$40,000s, and a two- times- the- national- average percentage of married- couple- with- children households. Their income is generated largely from salaries; and this segment has a very low level of income from public- assistance. No doubt owing to their younger age, there is a significantly above- average level of children under six- years- old. This group also has a nearly two- times- the- average number of people with some years of college under their military belts. Their occupational ranking is a mix of white- collar and blue- collar jobs in areas such as healthcare support, protective services, personal care, and farming.

## **Doublewides (O4)**

In America there tends to be a particular stigma attached to living in mobile homes and mobile home parks, but in fact, many people chose this lifestyle as a preference for several reasons, including mobility and low- cost housing. In fact, the median income of residents of Doublewides neighborhoods is a very respectable high- \$30,000s and \$40,000s. Doublewides are areas where mobile homes dictate the lifestyles of the residents, who share a median age in the 30s. While residents in Doublewides do have a higher- than- average level of income from public- assistance, many others are hardworking Americans, with a higher- than- average representation in several manual- labor blue- collar occupations, including farming/fishing/forestry (nearly three- times- average), construction (75% above average), repair services (50% above- average), transportation (50% above- average), and production (nearly 50% above- average). These occupations are a reflection of the residents' low educational achievements: There is an over- 50% average number of people with less- than- high- school educations. However, 25% above- average have high- school degrees. Also owing to their residents' ages, these areas have slightly more younger children than older. They tend to have married- couple households, but also have a nearly 50% higher- than- average number of single- fathers.

### **Group Quarters (O3)**

Group Quarters is the name of the neighborhoods identified as home to people living predominately in apartments or other group housing quarters. The residents of multifamily rental housing are different from both homeowners and single-family home renters. It's logical to imagine this group being much more transient than home-owning citizens, and not investing as much in their home purchases. Apartment renters account for 15% of all U.S. households by a narrow definition that restricts the count to residence in structures with at least five apartments. A broader definition of two to four apartments per quarters increases this percentage to 22%. Among the shared demographics of the highly urban Group Quarters residents are a median-age in the 30s, very few children, more singles than married-couples, and a two-times-the-national-average level of people with less-than-high-school educations. Income for these rental-housing residents ranks 50-percent-higher-than-average on public-assistance. However, many of the residents are employed in blue-collar jobs, such as farming/fishing/forestry (nearly four-times-average), protective services (nearly two-and-a-half-times-average), and healthcare support, building maintenance, and transportation (all about 25-percent-above-average). Incomes are in the high-\$30,000s and \$40,000s ranges.

### **East Meets West (O2)**

When most Americans think of people from the "East" then tend to think of Asians. And while many Asians moved to the United States in the past century, immigration trends of recent decades have brought many other citizens of other Eastern countries to the U.S. shores. You'll find many of them living together in East Meets West neighborhoods, which are areas comprised mainly of Asians, but also contain other groups for whom English or Spanish is not the primary language spoken at home. Among the shared demographics of these areas are a very interesting correlation to "national-average" measurements - which, interestingly, points to the fact that these groups of people have done a great job of assimilating into America culture. They rank at near-average levels in married-couple-with-children household compositions, and have average standings in all age ranges for kids. Some differences-from-the-average include: over 25-percent-average number of people with less-than-high-school educations, nearly 25-percent-average number of single-males-without-children, and nearly two-times-average level of public-assistance income. However, the median income range for East Meets West is quite high at \$50,000s and \$60,000s, which speaks to the fact that many residents are hard-working citizens. They show average levels of employment in a wide range of occupational categories, where

### **Golden Heritage (O1)**

When you think of senior citizens in America there are typically two images that come to mind. One is of very well off older citizens living comfortably, usually by the ocean, having the money both for a nice primary residence and for frequent vacations (perhaps in a comfortable recreational vehicle), playing shuffleboard or cards, and basically enjoying their post-working years to the hilt. The other image is less appealing: of older Americans struggling to make ends meet and waiting each month for their social security checks to arrive. Market segmentation analytics bear out the reality of both of these images. And Golden Heritage segments are neighborhoods that are home to the former: in other words, the senior citizens living the good life in places like Florida, Arizona, and other appealing climates. The media age of these residents is 50s to low-60s. But they also show a nearly four-times-average number of people over 65-years-old. These seniors are living comfortably on incomes in the median-range of the \$50,000s and \$60,000s. Much of their income is from social security and retirement (two-and-a-half-times-above-average). However, they also have a 75-percent-above-average level of interest/dividend income. Some of these seniors are still working at white-collar jobs in areas like management, professional and sales positions. There are many married-couples, but few children living in Golden

### **Los Trabajadores (N6)**

The Spanish-language name for this category should not be misconstrued to mean that everyone is generating income from jobs. While an average level of Los Trabajadores ("workers") residents are generating income from their occupations, these neighborhoods ranks the highest among the primarily Hispanic Mundo Latino areas for public-assistance income: over four-and-a-half-times-above-average. But nonetheless these areas are among the three segments within this category with the highest income levels: the high-\$30,000s to \$40,000s. As a result, those who work are in all likelihood hard workers. It helps that they are young: They are one of two segments with a median-age in the 20s. The dominant areas of employment for these workers are blue-collar jobs in farming/fishing/forestry (nearly four-times-average); building maintenance (over two-and-a-half-times-average); and transportation, construction, and food preparation (all at or above 50-percent-higher-than-national-averages). Like other Mundo Latino segments, Trabajadores have a higher-than-average-level of people with less-than-high-school educations (nearly three-times-average). Los Trabajadores areas have the highest percent of children of all the segments, especially kids under six (over 50-percent-above-average). They are also predominately single-parent homes, with about two-and-a-half-
